

Triton SWS UK Limited provides a Storm Water Management Solution for Severn Trent Water and SJ Roberts Homes.

Following an evaluation from Severn Trent Water's New Products CoP Group Waste team, Triton Stormwater Solutions 'Stormwater Management System' has been approved for use within Severn Trent on both AMP 6 Capital Projects and Developer Sites.

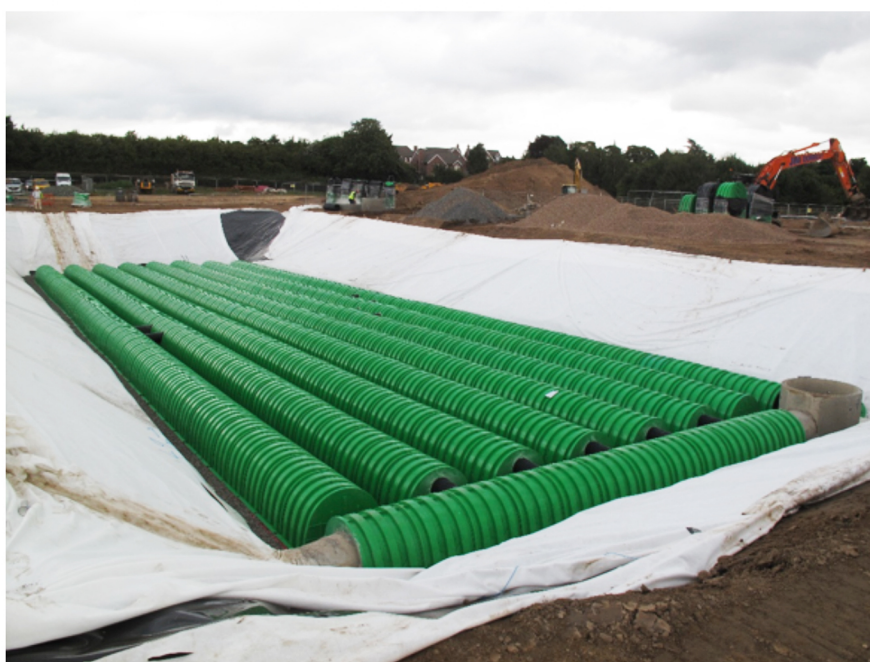

SJ Roberts Homes latest development of 173 houses at Sweetlake Meadows in Shrewsbury required a stormwater management system to provide in excess of 1043m³ water storage. A fundamental requirement for the system was that it had to be adopted by Severn Trent Water.

Triton SWS UK Limited were able to provide a system that would be positioned within a central area of public open space. The design utilised two layers of Tritons S-29 chambers which would provide the storage and access requirements for Severn Trent Water.

Once the impermeable liner by Waterlines and the main header row and access chamber were installed, the remainder of the lower level which consisted of 392 chambers took a team of 5 men only 5 hours to arrange.

SJ Roberts Homes, Steve Roberts "The installation went well, and we were impressed with the efficiency of the system throughout the process, from delivery and storage to installation and completion. Triton's early input during the design stage was critical and their work in liaising directly with the Project Engineer and Water Authority made the process straight forward."

David Cleveley Managing Director of Triton Stormwater Solutions UK limited : 'Triton is the next generation of Stormwater Management System, providing a maintainable, stronger and cost effective solution with a longer life. It is a great accolade for Triton to be recognised by one of the UK's largest Water Authorities. We are looking forward to providing the Severn Trent team and it's customers with storm water management solutions for future sites throughout the region.
